Weaver, Deborah / PreCalculus Chapter 10

A hyperbola is a type of conic section that looks somewhat like a letter x. A hyperbola is a set of all points P such that the difference between the distances from P to the foci, F 1 and F 2, are a constant K. Before learning how to graph a hyperbola from its equation, get familiar with the vocabulary words and diagrams below.

Formula and graph of a hyperbola. How to graph a hyperbola ...

Page 1 of 2 10.5 Hyperbolas 615 Hyperbolas GRAPHING AND WRITING EQUATIONS OF HYPERBOLAS The definition of a hyperbola is similar to that of an ellipse. For an ellipse, recall that the sum of the distances between a point on the ellipse and the two foci is constant. For a hyperbola, the difference is constant. A is the set of all points P such that the difference of the distances

Lesson 9-5 Chapter 9 31 Glencoe Algebra 1 Skills Practice Solving Quadratic Equations by Using the Quadratic Formula Solve each equation by using the Quadratic Formula. Round to the nearest tenth if necessary. 1. $x^2 - 49 = 0$ -7, 7 2. $x^2 - x - 20 = 0$ -4, 5 3. $x^2 - 5x - 36 = 0$ -4, 9 4. $x^2 + 11x + 30 = 0$ -6, -5 5. $x^2 - 7x = 2$ -3 0.5, 6.5 6. $x^2 + 4x = 0$...

NAME DATE PERIOD 9-5 Skills Practice

The vertex they gave me is 5 units above the center, so $a = 5$ and $a^2 = 25$. The slope of the asymptotes (ignoring the "plus-minus" part) is $a/b = 5/3 = 5/b$, so $b = 3$ and $b^2 = 9$. And this is all I need in order to find my equation: Find an equation of the hyperbola with x-intercepts at $x = -5$ and $x = 3$,

Conics: Hyperbolas: Find the Equation from Information

Note that the only difference in the asymptote equations above is in the slopes of the straight lines: If a^2 is the denominator for the x part of the hyperbola's equation, then a is still in the denominator in the slope of the asymptotes' equations; if a^2 goes with the y part of the hyperbola's equation, then a goes in the numerator of the slope in the asymptotes' equations.

Conics: Hyperbolas: Introduction - Purplemath

Equation. By placing a hyperbola on an x - y graph (centered over the x -axis and y -axis), the equation of the curve is: $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. Also: One vertex is at $(a, 0)$, and the other is at $(-a, 0)$. The asymptotes are the straight lines: $y = (b/a)x$; $y = -(b/a)x$ (Note: the equation is similar to the equation of the ellipse: $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, except for a "-" instead of a "+")
