Animal Form and Function. Animals vary in form and function. From a sponge to a worm to a goat, an organism has a distinct body plan that limits its size and shape. The term body plan is the “blueprint” encompassing aspects such as symmetry, segmentation, and limb disposition.

These animals have evolved so that the shape of their body allows them to live and flourish in their habitat, for example, primates with opposable thumbs. Unlike other animals primates are able to grasp and hold objects, which eventually led to our fine motor skills and development of tools.

Animal tissues are grouped into four basic types: connective, muscle, nervous, and epithelial. Collections of tissues joined in units to serve a common function compose organs. While all animals can generally be considered to contain the four tissue types, the manifestation of these tissues can differ depending on the type
