Other more complicated wave graphs could be studied. I happen to have this graph of a solution to the wave equation sitting around. Of course, adding graphs has interesting interpretations in terms of constructive and destructive interference. Or, if we add time I think you can get beats. There is much to explore here.

Good real-life examples of transformations of function graphs

Transforming the graph can also be used "backwards" in the case of linear transformations, to keep the graph in place and shift/scale the axes, instead. For example (courtesy wikipedia), this is what allows the following chart to display both Celsius

Transformation of Functions why and real life ...

Certain mathematical expressions allow you to combine stretching, shrinking, translating, and reflecting a function all into one graph. An expression that shows all the transformations in one is where a is the vertical transformation. c is the horizontal transformation. h is the horizontal shift. v is the vertical shift. For instance, $f(x) = -2(x - [...])$

How to Combine Various Transformations - dummies

Function Transformations Just like Transformations in Geometry , we can move and resize the graphs of functions Let us start with a function, in this case it is $f(x) = x^2$, but it could be anything:

Function Transformations

When applying multiple transformations, apply reflections first.

Multiplying a function by a constant other than 1, $a \cdot f(x)$, produces a dilation. If the constant is a positive number greater than 1, the graph will appear to stretch vertically. If the positive constant is a fraction less than 1, the graph will appear to stretch horizontally.

Graph rewriting - Wikipedia

The standard form of a quadratic function presents the function in the form $f(x) = a(x-h)^2 + k$ where (h, k) is the vertex. Because the vertex appears in the standard form of the quadratic function, this form is also known as the vertex form of a quadratic function.. The standard form is useful for determining how the graph ...

Graph $f(x) = -2x^2 + 12x - 9$ by using transformations. Now that we have completed the square to put a quadratic function into $f(x) = a(x - h)^2 + k$ form, we can also use this technique to graph the function using its properties as in the previous section.
