Download and build Bullet physics engine source code. Set up an Xcode project to use the Bullet physics libraries. Set up a physics simulation, create physical objects and make them move and rotate. Detect collisions, get collision information and destroy objects. And that's being very brief. Ray goes HARD with this tutorial.

In TouchDesigner, the Bullet Solver COMP is the primary operator of any physics simulation. It is responsible for running the simulation and solving for the transformations and velocities of each body that is in the simulation. Actor COMPs represent the bodies in the simulation, and Impulse Force/Force COMPs represent the forces.

I know I'm late, but I thought the accepted answer was only marginally better than the documentation's description. `timeStep`: The amount of seconds, not milliseconds, passed since the last call to `stepSimulation`..
`maxSubSteps`: Should generally stay at one so Bullet interpolates current values on its own. A value of zero implies a variable tick rate, meaning Bullet advances the simulation ...

I use Bullet for physics simulation and don't care about real-time simulation - it's ok if one minute of model time lasts two hours in real time. I am trying to call a callback every fixed amount of time in model time, but realized that I don't understand how `StepSimulation` works. The documentation of `StepSimulation()` isn't that clear. I would ...

Big physics sim with planets and whatnot. Many gravity wells and many objects inside those gravity wells. Physx thus far has proven to be jittery and unreal itself isn't able to handle more than an `int32` in default blueprint. Bullet supposedly fixes these things and also already has accurate physics of many types, especially for a sim like this.
