The Spectrum of Piezoelectric Motor Transducers Transducers which convert electrical energy to mechanical energy (i.e., motors) come in a wide range of shapes and sizes, each having their own characteristic force-displacement capabilities. Stiff (low compliance) transducers provide tremendous force but tiny motion.

A piezoelectric motor or piezo motor is a type of electric motor based on the change in shape of a piezoelectric material when an electric field is applied. Piezoelectric motors use the converse piezoelectric effect of piezoelectric sensors, in which deformation or vibration of the piezoelectric material produces an electric charge.

How it works. PCB Motors use the traveling wave principle to create the motion in the stator (see Figure 2).. The stator, made from the PCB itself, holds the actuators (piezo components) and electrical connecting circuit. The PCB can also hold the driver. The application rotor, pressed onto the surface of the stator, delivers the mechanical output. A traveling wave is generated over the stator ...

Regarding piezoelectric motors, the piezoelectric element receives an electrical pulse, and then applies directional force to an opposing ceramic plate, causing it to move in the desired direction. Motion is generated when the piezoelectric element moves against a static platform (such as ceramic strips).
