1.3 Design of Feedback Control Systems. Feedback control systems must be designed to suit a predetermined purpose. Normally, only the controller can be appropriately designed, whereas the process and the sensor are predetermined or constrained. Feedback control systems can be designed to achieve specific behavior of the output variable, for example.

This book shows root locus and Bode plots of state space design problems and clearly links the two sides. Other books follow the treatment of this great book. The only shortcoming is a lack of nonlinear analysis and a weak digital control treatment. But for continuous linear systems this is a great book to learn from. It is also great for self ...

Feedback System Block Diagram Model This basic feedback loop of sensing, controlling and actuation is the main concept behind a feedback control system and there are several good reasons why feedback is applied and used in electronic circuits: Circuit characteristics such as the systems gain and response can be precisely controlled.

## **Feedback Systems and Feedback Control Systems**

In a positive feedback control system the setpoint and output values are added. In a negative feedback control the setpoint and output values are subtracted. As a rule negative feedback systems are more stable than positive feedback systems. Negative feedback also makes systems more immune to random variations in component values and inputs.
