While transformation of E. coli by plasmids extracted from yeast cells is a routine laboratory procedure, transfer of genes integrated into a chromosome has not been extensively studied. We studied this process by using a *S. cerevisiae* strain that carries multiple copies of a recombinant plasmid integrated into its genome.

The Escherichia coli WP2 tryptophan reverse mutation assay detects trp⁻ to trp⁺ reversion at a site blocking a step in the biosynthesis of tryptophan prior to the formation of anthranilic acid. The different WP2 strains all carry the same AT base pair at the critical mutation site within the trpE gene. The assay is currently used by many laboratories in conjunction with the Ames Salmonella assay for screening chemicals for mutagenic activity.
