An engine control unit (ECU), also commonly called an engine control module (ECM), is a type of electronic control unit that controls a series of actuators on an internal combustion engine to ensure optimal engine performance. It does this by reading values from a multitude of sensors within the engine bay, interpreting the data using multidimensional performance maps (called lookup tables ...

An internal combustion engine (ICE) is a heat engine in which the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.

BMW started supplying their engines to Williams from 2000. In the first season, the engine was very reliable though slightly short of power compared to Ferrari and Mercedes units. BMW went straight forward with its engine development. The P81, used during the 2001 season, was able to hit 17,810 rpm.

Jet propulsion is the propulsion of an object in one direction, produced by ejecting a jet of fluid in the opposite direction. By Newton's third law, the moving body is propelled in the opposite direction to the jet. Reaction engines operating on the principle of jet propulsion include the jet engine used for aircraft propulsion, the pump-jet used for marine propulsion, and the rocket engine ...

"Engine control" is a no-brainer; "module" implies it's electrical in nature. And if that's not enough to enlighten you, well, at least you weren't the first to ask those questions. If you type "electronic control module," or its better-known acronym, ECM, into the search field, you'll be gently guided over to the ECU (engine control unit) page.

A jet engine is a type of reaction engine discharging a fast-moving jet that generates thrust by jet propulsion.While this broad definition can include rocket, water jet, and hybrid propulsion, the term jet engine typically refers to an airbreathing jet engine such as a turbojet, turbofan, ramjet, or pulse jet. In general, jet engines are combustion engines.

The electronic engine control unit (ECU) is the central controller and heart of the engine management system. It controls the fuel supply, air management, fuel injection and ignition. Due to the scalability of its performance, the control unit is also able to control the exhaust system as well as to integrate transmission and vehicle functions.

Maps, architecture and prop models use a scale of 1 foot = 16 units. Skyboxes (which are 1/16th scale of ordinary maps) use 1 foot = 1 unit. Human Character models for Source Engine currently use 1 foot = 12 units. Texturemaps are applied to Models and Brushwork in the Source Engine and are therefore scaled relative to game units.
