a polynomial with three terms. Polynomials with four or more terms have no special names. Thus, they are simply called polynomials. The degree of a term in a polynomial is the sum of the exponents of its variable factors. The degree of a constant term is zero. The degree of a polynomial is the largest degree of its terms. The term which determines

(Yes, "5" is a polynomial, one term is allowed, and it can be just a constant!) These are not polynomials. $3xy^{-2}$ is not, because the exponent is "-2" (exponents can only be 0,1,2,...); $2/(x+2)$ is not, because dividing by a variable is not allowed $1/x$ is not either \sqrt{x} is not, because the exponent is " $\frac{1}{2}$ " (see fractional exponents); But these are allowed: $x/2$ is allowed, because you can ...

Chapter 5 Exponents and Polynomials

The exponent of the second term, remember, negative $8x$, x is the same thing as x to the first power. So the exponent here is 1. And then on this last term, we already said, 7 is the same thing as $7x$ to the 0. So the exponent here on the constant term on 7 is 0. So these things right over here, those are our exponents. And we are done.

4.1 Exponents and Polynomials In Section 1.2 we defined an exponent as a number that tells how many times a factor occurs in a product. In fact, this definition applies to natural-number exponents only. Negative-integer exponents are discussed in Appendix I and, along with fractional exponents, are a major topic in intermediate algebra.

Polynomials in one variable are algebraic expressions that consist of terms in the form $\{a\{x^n\}$ where $\{n\}$ is a non-negative (i.e. positive or zero) integer and $\{a\}$ is a real number and is called the coefficient of the term. The degree of a polynomial in one variable is the largest exponent in the polynomial.
