#### **Edwin F. Taylor**

If  $f$  and  $g$  are two functions with overlapping domains, then for all  $x$  common to both domains, the sum is  $(f + g)x = f(x) + g(x)$ . Replace  $f(x)$  with  $14x - 3$ , and  $g(x)$  with  $8x^2$  in the equation. We get  $(f + g)x$  as  $8x^2 + 14x - 3$ .

the demand curve to find that the quantity of wheat that buyers will be willing and able to purchase is  $W_1$  bushels. Reading over to the supply curve, we find that sellers will offer  $W_2$  bushels of wheat at the price floor of  $P_F$ . Because  $P_F$  is above the equilibrium price, there is a surplus of wheat equal to  $(W_2 - W_1)$  bushels.

(Section 2.1: An Introduction to Limits)

#### 2.1.4 Example 2

(Evaluating the Limit of a Rational Function at a Point) Let  $x$

$f(x) = \frac{2x + 1}{x^2}$ . Evaluate  $\lim_{x \rightarrow 3} f(x)$ .

§ Solution  $f$  is a rational function with implied domain  $\text{Dom}(f) = \{x \mid x \neq 0\}$ . We observe that 3 is in the domain of  $f$  (in short,  $3 \in \text{Dom}(f)$ ), so we

substitute (“plug in”)  $x = 3$
