Fourier transform(FT) is a mathematical transform that decomposes a function (often a function of time, or a signal) into its constituent frequencies, such as the expression of a musical chord in terms of the volumes and frequencies of its constituent notes.

Our aim in this chapter is to develop a concept, called Fourier transform, in which to a non-periodic function f , we shall assign for each $\omega \in \mathbb{R}$ a function F defined on \mathbb{R} such that $F(\omega) \in \mathbb{C}$. This function F will be called Fourier transform of the non-periodic function f . The difference, we note, in a Fourier series and...

The Fourier transform of a time dependent signal produces a frequency dependent function. A lot of engineers use ω because it is used in transfer functions, but here we are just looking at frequency. If

transform (DFT) converts a finite sequence of equally-spaced samples of a function into a same-length sequence of equally-spaced samples of the discrete-time Fourier transform (DTFT), which is a complex-valued function of frequency. The interval at which the DTFT is sampled is the reciprocal of the duration of the input sequence.
