In orbital mechanics, the universal variable formulation is a method used to solve the two-body Kepler problem. It is a generalized form of Kepler's Equation, extending them to apply not only to elliptic orbits, but also parabolic and hyperbolic orbits. It thus is applicable to many situations in the solar system, where orbits of widely varying eccentricities are present.

Action is another quantity in analytical mechanics defined as a functional of the Lagrangian: $S = \int_{t_1}^{t_2} L(q, \dot{q}, t) dt$. A general way to find the equations of motion from the action is the principle of least action: $\delta S = 0$, where the departure t_1 and arrival t_2 times are fixed. The term "path" or "trajectory" refers to the time evolution of the system as a path through configuration space, in ...
