Granitoid gneiss is a variety of metamorphic gneiss that appears to have bands of black and white minerals such as feldspar and mica. These bands form from the heating and squeezing of the rock although, granitoid gneiss may look very similar to the original granite rock. Granitoid gneiss is medium- to coarse-grained and occurs around the world.

The breccia consists of subangular to angular fragments of granitoid rock, phenocrysts presumably derived from the granitoid rocks, fragments of diabase, and fragments of highly deformed amphibolite (Figure 2.28 G). The matrix is a fine-grained metamorphic-textured fragmental rock (see Pattison, 1979). The Footwall Breccia contains 1-25% sulfide, and tends to be chalcopyrite-rich (>75% of the sulfide).

A granitoid or granitic rock is a variety of coarse grained plutonic rock — granite or similar — which mineralogically is composed predominantly of feldspar, quartz and mica. Examples of granitoid rocks include granite, quartz monzonite, quartz diorite, syenite, granodiorite, tonalite and trondhjemite. Many are created by continental volcanic arc subduction or the collision of sialic masses.

B) Petrologist's Definition. Granite is a plutonic rock in which quartz makes up between 10 and 50 percent of the felsic components and alkali feldspar accounts for 65 to 90 percent of the total feldspar content. Applying this definition requires the mineral identification and quantification abilities of a competent geologist.
