## Icebergs Glaciers

Icebergs float in salt water because they are formed by calving, or splitting, glaciers and are thus made of fresh water. The size of icebergs varies widely. Small bergs (a little smaller than a car) are known as "growlers," while slightly larger bergs (about the size of a house) are called "bergy bits."

## All About Icebergs — Icebergs and Glaciers — Beyond ...

Icebergs float in the ocean, but are made of frozen freshwater, not saltwater. Most icebergs in the Northern Hemisphere break off from glaciers in Greenland. Sometimes they drift south with currents into the North Atlantic Ocean. Icebergs also calve from glaciers in Alaska.

### **Icebergs & Glaciers - HarperCollins**

Icebergs and glaciers are both enormous masses of snow, built up over the years through natural processes. However, they are both different from each other in form and structure, as well process of formation. Glaciers are formed by continual deposition of snow at a place where it does not melt.

Icebergs calved from tidewater glaciers are still a danger today. An iceberg over 80 kilometers long and 40 kilometers wide recently broke off from the Larsen Sea Shelf in Antarctica. Many ships sail in this area, so satellites monitor the area for any icebergs that may be in a ship's path.

An iceberg is a large piece of freshwater ice that has broken off a glacier or an ice shelf and is floating freely in open water. Small bits of disintegrating icebergs are called "growlers" or "bergy bits". Much of an iceberg is below the surface which led to the expression "tip of the iceberg" to illustrate a small part of a larger unseen issue. Icebergs are considered a serious maritime hazard. The 1912 loss of the RMS Titanic led to the formation of the International Ice Patrol in 1914. Icebe
