Some relationships cannot be represented by an explicit function. For example, $x^2 + y^2 = 1$. Implicit differentiation helps us find dy/dx even for relationships like that. This is done using the chain rule, and viewing y as an implicit function of x . For example, according to the chain rule, the

Implicit Function Questions and Answers | Study.com

Implicit differentiation problems are chain rule problems in disguise. Here's why: You know that the derivative of $\sin x$ is $\cos x$, and that according to the chain rule, the derivative of $\sin(x^3)$ is $3x^2 \cos(x^3)$. You could finish that problem by doing
