In a Hidden Markov Model (HMM), we have an invisible Markov chain (which we cannot observe), and each state generates in random one out of k observations, which are visible to us. Let's look at an example. Suppose we have the Markov Chain from above, with three states (snow, rain and sunshine), P - the transition probability matrix and q — the initial probabilities. This is the invisible Markov Chain — suppose we are home and cannot see the weather.

Introduction to Hidden Markov Models - Towards Data Science

A first-order Markov model is one in which the value of the next data point in the sequence is assumed to be statistically dependent only on the current data point. In a second-order Markov model, the next data point is assumed to be dependent on the preceding two data points.
