response to an antigenic stimulus requires the successive ligation of a range of T lymphocyte receptors by MHC-presented antigen, molecules expressed on the surfaces of accessory cells and lymphokines. A range of intracellular signalling systems are involved, with the possibility of alternative activation pathways utilising different intracellular

appears on the surface of the activated helper T cells, and the CD40 protein on the B-cell surface. The helper T cell also secretes cytokines, which can interact with the B cell and provide additional stimulation.

Immune system - Activation of T and B lymphocytes | Britannica

Where To Download Mechanisms Of Lymphocyte

Two independent signals are required by lymphocytes for a complete activation. A preliminary antigen-specific signal is sent through antigen receptors: T-cell receptor (TCR) on T-cells and surface Ig on B-cells. A second signal is known as co-stimulation that is independent of the antigen receptor and is imperative for a complete activation.
