### Modulo 3

In mathematics, the modulo is the remainder or the number that's left after a number is divided by another value. Modulo is also referred to as 'mod.' The standard format for mod is: a mod n Where a is the value that is divided by n. For example, you're calculating 15 mod 4. When you divide 15 by 4, there's a remainder.  $15 / 4 = 3.75$

Modulo operations might be implemented such that a division with a remainder is calculated each time. For special cases, on some hardware, faster alternatives exist. For example, the modulo of powers of 2 can alternatively be expressed as a bitwise AND operation:  $x \% 2^n == x \& (2^n - 1)$  Examples (assuming x is a positive integer):  $x \% 2 == x \& 1$

Modulo Method. To find  $1 \bmod 3$  using the Modulo Method, we first divide the Dividend (1) by the Divisor (3). Second, we multiply the Whole part of the Quotient in the previous step by the Divisor (3). Then finally, we subtract the answer in the second step from the Dividend (1) to get the answer.

Modulo 3 . Ever encountered this one? `int Index; // 0, 1 or 2  
int Index2 = (Index+1)%3;  
int Index3 = (Index+2)%3;` It appears all over the place, in particular when you have some algorithm working on vertices, and "Index" is the index of a particular component, i.e. X, Y or Z. Each time I see this code I feel terribly sorry for the poor guy who ...

In terms of the definition below, 15 is congruent to 3 modulo 12, so "15:00" on a 24-hour clock is displayed "3:00" on a 12-hour clock. Congruence. Given an integer  $n > 1$ , called a modulus, two integers are said to be congruent modulo  $n$ , if  $n$  is a divisor of their difference (i.e., if there is an integer  $k$  such that  $a - b ...$

The result of a modulo operation  $n \% m$  is just that number  $r$  for which  $q * m + r = n$  ( $q$  may be anything). The only requirement we have is that  $0 \leq r < m$ . So for instance:  $7 \% 5 \rightarrow 1 * 5 + 2 == 7 \rightarrow r = 2$   $1 \% 3 \rightarrow 0 * 3 + 1 == 1 \rightarrow r = 1$

About Modulo Calculator . The Modulo Calculator is used to perform the modulo operation on numbers. Modulo. Given two numbers, a (the dividend) and n (the divisor), a modulo n (abbreviated as a mod n) is the remainder from the division of a by n. For instance, the expression "7 mod 5" would evaluate to 2 because 7 divided by 5 leaves a remainder of 2, while "10 mod 5" would evaluate to ...
