Organolithium reagents are organometallic compounds that contain carbon - lithium bonds. They are important reagents in organic synthesis, and are frequently used to transfer the organic group or the lithium atom to the substrates in synthetic steps, through nucleophilic addition or simple deprotonation. Organolithium reagents are used in industry as an initiator for anionic polymerization ...

Due to the presence of unoccupied orbitals on the metal atom, electron-deficient organometallic compounds are observed to be Lewis acids. e.g. $\text{B}(\text{C}_6\text{H}_5)_3 + \text{LiC}_6\text{H}_5 \rightarrow \text{Li}[\text{B}(\text{C}_6\text{H}_5)_4]$ This reaction may be viewed as the transfer of the strong base C_6H_5^- from the weak Lewis acid Li^+ to the stronger acid $\text{B}(\text{III})$.

Highly dispersed low-coordinate Pd sites on SiO_2 are fabricated by grafting the Pd II PCP-pincer complex $(\text{tBu PCP})\text{Pd}-\text{OH}$ ($\text{tBu PCP} = 2,6\text{-C}_6\text{H}_3(\text{CH}_2\text{P}(\text{tBu})_2)_2$) on SiO_2 , followed by calcination with ozone (100°C) and reduction with H_2 (300°C).

Coordination compounds can be obtained in the gas phase by direct interaction of vaporized atomic metals and ligands. However, the scope of this approach is strongly limited by the instability of complexes at high temperatures. The highest efficiency in gas-phase syntheses is attained by co-condensation of metal vapors and ligands at low ...

Direct Synthesis of Coordination and Organometallic Compounds

Main Group Organometallic Compounds. Organic compounds incorporating carbon-metal bonds are called organometallic compounds. Such compounds have been known and studied for nearly 200 years, and their unique properties have been widely used to effect synthetic transformations.

A coordination complex consists of a central atom or ion, which is usually metallic and is called the coordination centre, and a surrounding array of bound molecules or ions, that are in turn known as ligands or complexing agents. Many metal-containing compounds, especially those of transition metals, are coordination complexes. A coordination complex whose centre is a metal atom is called a ...
