Physics Form 5: Chapter 1 - Interference of Waves. Interference is the effect of superposition of two waves from two coherent sources. Coherent waves are the waves that can produce same frequency, same amplitude and same phase (or with constant phase difference). The principle of superposition states that when two waves meet at the same point, the resultant displacement at that point is equal to the vector sum of the displacements produced by the individual waves at that point.

Physics Form 5: Chapter 1 - Diffraction Diffraction is the spreading of a wave as it goes through a narrow gap or passes round a small obstacle. The effect of diffraction increases when the width of the gap is decreased. The effect of diffraction increases when the wavelength is increased.
