A centrifugal pump is a nonpositive displacement, dynamic machine that transfers mechanical energy into a practical and useful form called pressure. The pump first converts this energy from water into velocity with a circular (centrifugal) force and then into head or elevation (pressure energy) as it passes from the eye of the pump, through the impeller and finally through the casing and volute.

How To Select A Centrifugal Pump - PM Engineer

Using the total head and the flow rate, the appropriate dynamic pump (centrifugal pump) can be selected. Selection Using Pump Characteristics. Whenever there is a need to select a pump for any industrial or personal requirement, it is important to determine the required total head for the operation and the required flow rate.

Centrifugal pump selection and characteristics - Wikipedia

Choosing a centrifugal pump from the countless options available can be daunting, but someone has to make the decision. Many factors, such as the required flow, differential pressure, and suction conditions must be weighed against the capital costs and cost of energy for the pumps considered.

How to select the right centrifugal pump

Centrifugal pump selection Based on the maximum process flow requirement, select a pump or multiple parallel or series pumps that have performance curve(s) that meet the maximum requirements while operating in the pump's POR and that have an NPSHR with sufficient margin below the NPSHA.

CENTRIFUGAL PUMP SELECTION, SIZING, AND INTERPRETATION OF PERFORMANCE CURVES 4.0 PUMP CLASSES Pumps may be classified in two general types, dynamic and positive displacement. Positive displacement pumps are those in which energy is imparted to the liquid in a fixed displacement volume, such as a casing or a cylinder, by the rotary motion of gears.

CENTRIFUGAL PUMP SELECTION, SIZING, AND INTERPRETATION OF ...

When selecting a centrifugal pump, it is crucial to identify the accurate duty point. Net Positive Suction Head (NPSH) Made Available. The NPSH is determined by subtracting the vapour head of the fluid being pumped from the total absolute head at the point of pump suction.

Factors in Choosing the Right Centrifugal Pump

Selecting Centrifugal Pumps. Typical selection criteria for centrifugal pumps are their design data (flow rate or capacity Q, discharge head H, speed of rotation n and NPSH), the properties of the fluid pumped, the application, the place of installation and the applicable regulations, specifications, laws and codes.

To do this, simply refer to the selection chart on page 4 & 5 where the full line of Goulds Pumps, Rheinütte Pumpen and PRO Services products are listed by

Centrifugal Pump Selection Guide - Goulds Pumps

When replacing a centrifugal pump motor, it is important to select one that has the same voltage and service factor. This is especially true in the case of small single phase motors where the service factor may be quite large. For example, a typical 3/4HP jet pump with a 1.45 service factor actually has almost 1.1HP available.

Centrifugal pump motor selection, installation and start ...

Centrifugal pump selection is defined by a few key specifications, including flow rate, head, power, and efficiency. Flow rate describes the rate at which the pump can move fluid through the system, typically expressed in gallons per minute (gpm).

Centrifugal Pumps Selection Guide | Engineering360

A centrifugal pump has a best efficiency point (BEP) somewhere on its pump curve. These are the precise conditions, determined by the manufacturer, where the pump operates with greatest efficiency and at which it can be expected to have maximum working life and experience lower maintenance.

Centrifugal Pump Selection - Michael Smith Engineers

A centrifugal pump is a machine that uses rotation to impart velocity to a liquid. It then converts that velocity into flow. Centrifugal pumps are made up of two primary components: an impeller and a casing. The rotating impeller generates velocity and the casing converts velocity into flow.
