$a_n = a + (n - 1)d$. An arithmetic series is the sum of an arithmetic sequence. We find the sum by adding the first, a 1 and last term, a n, divide by 2 in order to get the mean of the two values and then multiply by the number of values, n: $S_n = \frac{n}{2} (a + a_n)$

Now you know about sequences, the next thing to learn about is how to sum them up. Read our page on Partial Sums. When we sum up just part of a sequence it is called a Partial Sum. But a sum of an infinite sequence it is called a "Series" (it sounds like another name for sequence, but it is actually a sum).

Sequences and series are most useful when there is a formula for their terms. For instance, if the formula for the terms a n of a sequence is defined as "a n = 2n + 3", then you can find the value of any term by plugging the value of n into the formula. For instance, a 8 = 2(8) + 3 = 16 + 3 = 19. In words, "a n = 2n + 3" can be read as "the n-th term is given by two-n plus three".

Sequences and Series: Terminology and Notation | Purplemath

Sequences and series are often the first place students encounter this exclamation-mark notation. The notation doesn't indicate that the series is "emphatic" in some manner; instead, this is technical mathematical notation. It indicates that the terms of this summation involve factorials. (If you're not familiar with factorials, brush up now.)

Sequences and Series: Basic Examples | Purplemath

794 The nth term in the series is given by the sum of x^n for x in the range 1 to 3, i.e. $1^n + 2^n + 3^n$. Thus the first term is $1^1 + 2^1 + 3^1 = 1 + 2 + 3 = 6$.

Build a sequence of numbers in the following fashion. Let the first two numbers of the sequence be 1 and let the third number be $1 + 1 = 2$. The fourth number in the sequence will be $1 + 2 = 3$ and the fifth number is $2 + 3 = 5$. To continue the sequence, we look for the previous two terms and add them together. So the first ten terms of the ...
