An agent-based model (ABM) is a class of computational models for simulating the actions and interactions of autonomous agents (both individual or collective entities such as organizations or groups) with a view to assessing their effects on the system as a whole. It combines elements of game theory, complex systems, emergence, computational sociology, multi-agent systems, and evolutionary programming.

Agent-based model - Wikipedia

Self-organization, also called spontaneous order, is a process where some form of overall order arises from local interactions between parts of an initially disordered system. The process can be spontaneous when sufficient energy is available, not needing control by any external agent. It is often triggered by seemingly random fluctuations, amplified by positive feedback. The resulting organization is wholly decentralized, distributed over all the components of the system. As such, the organization

Social Group Agents Social groups often provide the first experiences of socialization. Families, and later peer groups, communicate expectations and reinforce norms. People first learn to use the tangible objects of material culture in these settings, as well as being introduced to the beliefs and values of society.

Agents of Socialization | Introduction to Sociology

The self has meaning only within the social context, and it is not wrong to say that the social situation defines our self-concept and our self-esteem. We rely on others to provide a “social reality”—to help us determine what to think, feel, and do (Hardin & Higgins, 1996).

Self-organization has been linked to resilience, particularly in situations of low predictability in which agents use a variety of strategies to survive or meet some objective. This underlies the adaptive response described in the panarchy model (Chapter 6.5.7). The nature of a self-organization in society depends largely on existing structures, perceptions, and values; for
