: The Physics of Solar Cells and IV Curves (July 22nd 2pm-4pm MT) In this course we describe the fundamental structure of solar cells at the atomic level and how that structure results in a one-way flow of electrons out of a cell when exposed to sunlight. We explain about p-type and n-type doping and how photons of light create hole-electron pairs.

Solar energy, radiation from the Sun capable of producing heat, causing chemical reactions, or generating electricity. The total amount of solar energy incident on Earth is vastly in excess of the world's current and anticipated energy requirements.

solar energy | Description, Uses, & Facts | Britannica

A solar cell is an electrical device that converts the solar energy into electric current. A large number of solar cells spread over a large area can work together to convert the light into electricity. The more light that hits a solar cell, the more electricity it generates. The most common solar cells are made from silicon semiconductor.
