History. Differential equations first came into existence with the invention of calculus by Newton and Leibniz. In Chapter 2 of his 1671 work Methodus fluxionum et Serierum Infinitarum, Isaac Newton listed three kinds of differential equations: $y' = f(x)$, $y' = f(y)$, and $y' = f(x, y)$. In all these cases, y is an unknown function of x (or of t), and f is a given function. He solves these examples and ...

In mathematics, differential calculus is a subfield of calculus that studies the rates at which quantities change. It is one of the two traditional divisions of calculus, the other being integral calculus—the study of the area beneath a curve.. The primary objects of study in differential calculus are the derivative of a function, related notions such as the differential, and their applications.

Solving Differential Equations (DEs) A differential equation (or "DE") contains derivatives or differentials. Our task is to solve the differential equation. This will involve integration at some point, and we'll (mostly) end up with an expression along the lines of " $y = \dots$ ".
