Solution: Let $x[n]$ denote the input to the system, $w[n]$ the output after upconversion, $g[n]$ the output after passing through the filter $H(e^{j\omega n})$ and $y[n]$ denote the overall output of the cascade system. Also, let $h[n]$ be the impulse response of the filter. We already know that the system is linear.

Converters such as an Analog-to-Digital converter then take the real-world signal and turn it into the digital format of 1's and 0's. From here, the DSP takes over by capturing the digitized information and processing it. It then feeds the digitized information back for use in the real world.

Digital signal processing algorithms are powerful tools that provide algorithmic solutions to common problems For example, digital filters provide several benefits over their analog counterparts These algorithms are traditionally implemented using dedicated digital signal processing (DSP) chips,

Digital Signal Processing Problems And Solutions

Spectral analysis using the Fourier transform, a non-parametric method are commonly used today in digital signal processing (DSP) applications, is called discrete Fourier transform (DFT). A smart algorithm for calculating the DFT, causing less computational load for a digital computer, is the fast Fourier transform (FFT).
