The application of variational inequalities to free-boundary problems arising in the flow of fluids through porous media was studied by Baiocchi[13] and Baiocchi et al., and a numerical analysis of such problems was investigated by Baiocchi et al. [15].

Variational inequalities (equilibrium or evolution problems typically with convex constraints) are carefully explained in An Introduction to Variational Inequalities and Their Applications. They are shown to be extremely useful across a wide variety of subjects, ranging from linear programming to free boundary problems in partial differential equations.

In this paper, we propose a new parallel splitting descent method for solving a class of variational inequalities with separable structure. The new method can be applied to solve convex optimization problems in which the objective function is separable with three operators and the constraint is linear. In the framework of the new algorithm, we adopt a new descent strategy by combining two ...

For applications, first the existence result for the solutions of an \mathcal{L} -fuzzy Caputo-Fabrizio fractional differential inclusion initial value problem involving a projection operator has been proved. Then the solutions of an obstacle boundary value variational inequality problem in function spaces has been obtained.

In mathematics, a variational inequality is an inequality involving a functional, which has to be solved for all possible values of a given variable, belonging usually to a convex set. The mathematical theory of variational inequalities was initially developed to deal with equilibrium problems, precisely the Signorini problem: in that model problem, the functional involved was obtained as the ...

Variational inequality theory was introduced by Hart- man and Stampacchia (1966) as a tool for the study of partial differential equations with applications principally drawn from mechanics. Such variational inequalities were infinite-dimensional rather than finite-dimensional as we will be

Variational Inequalities - Anna Nagurney

Functional and geometric inequalities play a vital role across the calculus of variations, partial differential equations, and geometry. Given an inequality for which equality is attained and equality cases are characterized, a natural question is that of stability: Suppose a function almost achieves equality in the inequality.

In this paper, we present a modified extragradient-type method for solving the variational inequality problem involving uniformly continuous pseudomonotone operator. It is shown that under certain mild assumptions, this method is strongly convergent in infinite dimensional real Hilbert spaces.
