For example if the x component is zero then $(2, -3, 5) \cdot (0, y, z) = -3y + 5z$ is solved when $y = 5k$ and $z = 3k$ for any scalar k. In other words, the vectors $a = (0, 5, 3)$ and $b = (3, 2, 0)$ are orthogonal. For a point in the plane $2x - 3y + 5z = 30$, set any two of x, y, and z to zero. For example (0, 0, 6) is in the plane.

1 Vectors in Euclidean Space 1.1 Introduction In single-variable calculus, the functions that one encounters are functions of a variable (usually x or t) that varies over some subset of the real number line (which we denote by R). For such a function, say, $y=f(x)$, the graph of the function f consists of the points $(x, y) = (x, f(x))$. These points lie in the Euclidean plane, which, in the Cartesian ...
